     Pred. No. is the number of results predicted by chance to h score greater than or equal to the score of the result bein and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                       Score

The sequence A is an octapeptide motif from the prion protein (PrP). The ligands are identified by binding assays with the peptide (A) or peptides containing (A). The ligands are used for detecting prion proteins (or prions) in biological or environmental samples, e.g. for diagnosis, also for removing them from samples, for treating or retarding development of prion-associated diseases, especially Creutzfeldt-Jakob diseases (in latrogenic, new variant, familial or sporadic forms), but also

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ъ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC The present invention describes a method (M1) for inactivating a CC transmissible spongiform encephalopathy (TSE) agent comprising exposing CC the TSE agent to a thermostable proteolytic enzyme. Also described: CC (1) a composition (I) for inactivating a TSE agent, comprising a CC prion dimer which does not bind to a prion monomer; and (3) a purified CC prion dimer which does not bind to a prion monomer; and (3) a purified CC prion dimer (M1) is useful for inactivating a TSE agent kuru, fatal CC familial insomnia, Gerstmann-Straussler-Scheinker syndrome, bovine CC spongiform encephalopathy, scrapte, feline spongiform encephalopathy, (I) is chronic wasting disease or transmissible mink encephalopathy. (I) is CC useful for sterilising material contaminated with the TSE agent. A prion CC dimer is useful for examining a sample infected with or suspected to be infected by a prion protein, and for detecting prion infectivity, by CC detecting a prion dimer in the sample. A prion dimer is useful for cramining an animal with a prion dimer, obtaining its extract which contains (II), and isolating (II) from the extract. The method comprises obtaining an animal with a prion dimer, obtaining its capacity of the useful for inactivating TSE agents in potentially contaminated clinical waste and culled animal material. (M1) is useful for even walls of rooms. The present sequence represents a prion mimetic correspondence which is used in an example from the preparation in the correspondence which is useful for an example from the present and the prion dimer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

The method comprises detecting abnormal prion protein in a biological sample. The sample is treated with at least one proteinase K while retaining at least some of the octapeptide repeats in the prion protein, then treatment with a ligand for octapeptide repeats and detecting any formation of a complex. The method is used to diagnose ESST, particularly (new variant) Creutzfeld-Jakob diseases, bovine spongiform encephalopathy and
polypeptide containing the sequence GlyTyrGlyGlnProHisGlyGly (A) or an analogue that is the retro-inverso isomer of (A). The sequence A is an octapeptide motif from the prion protein (PrP). The ligands are identified by binding assays with the peptide (A) or peptides containing (A). The ligands are used for detecting prion proteins (or prions) in

The present sequence is a peptide containing the Pre octapeptide A (containing the octapeptide in a different permutation to that shown in AAU11825) used to isolate the ligands of the invention.

These peptides and antibodies raised against these may be used to treat or prevent spongiform encephalopathy in humans, sheep or cattle. They can be used to block cellular binding and aggregation of prion proteins and to stimulate the mammalian immune system. These peptides may be used to distinguish between the normal form of prion protein (PTe) and the scrapic-associated form (PTeSc). These peptides may include rare or synthetic amino acids or a rationinverso peptide modification to improve resistance to enzymatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequences given in AAR38025-36 represent polypeptides derived I an antigenic site, region E, of a prion protein. Prion proteins comprise six regions of interest (A-F), and two related frame shift to the compress of interest (A-F), and two related frame shift compress the compress of the compress o

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    peptides sequences caused by a repeating section in region E having a nucleic acid coding sequence frame shift mutation of +1 (FSa) or -1 (FSb) (see also AAR38037-38). These peptides and antibodies raised against these may be used to treat or prevent spongiform encephalopathy in humans, sheep or cattle. They can be used to block cellular binding and aggregation of prion proteins and to stimulate the mammalian immune system. These peptides may be used to distinguish between the normal form of prion protein (PrPo) and the scrapic-associated form (PrPsc). These peptides may include rare or synthetic amino acids or a ration of protein (PrPsc) and the scrapic-associated form (PrPsc).

                                                                                                                          The sequences given in AAR38025-36 represent polypeptides derived from an antigenic site, region E, of a prion protein. Prion proteins comprise six regions of interest (A-F), and two related frame shift peptides sequences caused by a repeating section in region E having a nucleic acid coding sequence frame shift mutation of +1 (FSa) or -1 (FSb) (see also AAR38037-38). These peptides and antibodies raised against these may be used to treat or prevent spongiform encephalopathy in humans, sheep or cattle. They can be used to block cellular binding and aggregation of prion proteins and to stimulate the mammalian immune system. These peptides may be used to distinguish between the normal form of prion protein (PrPc) and the scraple-associated form (PrPsc). These peptides may include rare or synthetic amino acids or a ration of protein modification to improve resistance to enzymatic

Prion proteins comprise six regions of interest (A-F), and two related frame shift peptides sequences caused by a repeating section in region E having a nucleic acid coding sequence frame shift mutation of +1 (FSa) or -1 (FSb) (see also AAR38037-38). These peptides and antibodies raised against these may be used to treat or prevent spongiform encephalopathy in humans, sheep or cattle. They can be used to block cellular binding and aggregation of prion proteins and to stimulate the mammalian immune system. These peptides may be used to distinguish between the normal form of prion protein (PFPc) and the scrapie-associated form (PFPsc). These peptides may include rare or synthetic amino acids or a ratio-inverse peptide modification to improve resistance to enzymatic

The method comprises (a) selecting a polypeptide that has a length of at least 10 amino acids and has an amino acid sequence at least 70% homologous to that of human, bovine or murine PrP in a region of at least 10 consecutive amino acids (b) binding a metal to the polypeptide by reaction with a metal compound and (c) injecting the metal-containing polypeptide into a host animal, optionally together with adjuvants, to induce production of a polyclonal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Diagnostic polyclonal antiserum specific for prion protein obtained by immunisation with metal-containing polypeptide % \left( 1\right) =\left\{ 1\right\}

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention claims to provide a method for detecting transmissable spongiform encephalopathies (TSE) in animals and in animal carcasses. The method comprises of an immunological assay whereby the animal test sample is reacted with a labelled antibody against scrapie prion protein (prpSC) and the amount of bound labelled antibody is then detected. The anti-prpSC antibodies used in the assay are raised against fragments of the present synthetic peptide shown. The peptide fragments preferred by the inventors are shown in the features table. The method is claimed to be useful when applied to samples, particularly a cross-section of the spinal cord, from cattle, sheep and pig carcasses for detection of bovine spongiform encephalopathy (BSE) or scrapie.

Conversion of the normal cellular form of PrP into an aggregated, incomplete isoform is implicated in the pathogenesis of Transmissible spongiform Encephalopathies (TSEs). Examples of TSEs include Bovine spongiform Encephalopathy (BSE), Scrapic, Creutzfeldt-Jakob disease (CJD) and Gerstmann-Straussler-Sheinker syndrome (GSS). The concentration of this protein in body fluid or tissue samples may be measured by an assay of the present invention, in which a presence of PrP indicates TSE. PrP antibody, which is then detected. The presence of PrP indicates TSE. PrP epitopes (AABO7320-B07326) are derived from the protease resistant core
                                                                                                                                (WALL-)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is the human prion protein (PrP) sequence. Conversion of the normal cellular form of PrP into an aggregated, insoluble isoform is implicated in the pathogenesis of Transmissible spongiform Encephalopathies (TSEs). Examples of TSEs include Bovine spongiform Encephalopathy (BSE), scraple, Creutzfeldt-Jakob disease (CJD) and Gerstmann-Straussler-Sheinker syndrome (GSS). The concentration of this protein in body fluid or tissue samples may be measured by an assay of the present invention, in which a PrP epitope is captured by an antibody, which is then detected. The presence of PrP indicates TSE. PrP epitopes (AABO7320-B07326) are derived from the protease resistant core of PrP that is occluded when the PrP is in an aggregated state.
The present sequence is the mouse prion protein (PrP) sequence. Conversion of the normal cellular form of FrP into an aggregated, insoluble isoform is implicated in the pathogenesis of Transmissible Spongiform Encephalopathies (TSEs). Examples of TSEs include Bovine Spongiform Encephalopathy (BSE), scrapie, Creutzfeldt-Jakob disease

          The present sequence is the human prion protein (PrP) sequence. Conversion of the normal cellular form of PrP into an aggregated, insoluble isoform is implicated in the pathogenesis of Transmissible spongiform Encephalopathies (TSEs). Examples of TSEs include Bovine Spongiform Encephalopathy (BSE), scrapie, Creutzfeldt-Jakob disease (CJD) and Gerstmann-Straussler-Sheinker syndrome (GSS). The concentration of this protein in body fluid or tissue samples may be measured by an assay of the present invention, in which a PrP epitope is captured by an antibody, which is then detected. The presence of PrP indicates TSE. PrP
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (CJD) and Gerstmann-Straussler-Sheinker syndrome (GSS). The concentration of this protein in body fluid or tissue samples may be measured by an assay of the present invention, in which a PrP epitope is captured by an antibody, which is then detected. The presence of PrP indicates TSE. PrF epitopes (AAB07320-B07326) are derived from the protease resistant core of PrP that is occluded when the PrP is in an aggregated state.
                                                                                                                                                                                 New immunoassay for prion protein, used for

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
